

# Lean booster

Boost your lean practices through data science

You want to give a boost to your lean practices and outcomes

You are engaged in a lean management program and you want to get more out of it, With the power of Data Science and Artificial Intelligence Lean Booster can help.

# In Focus: Lean Booster

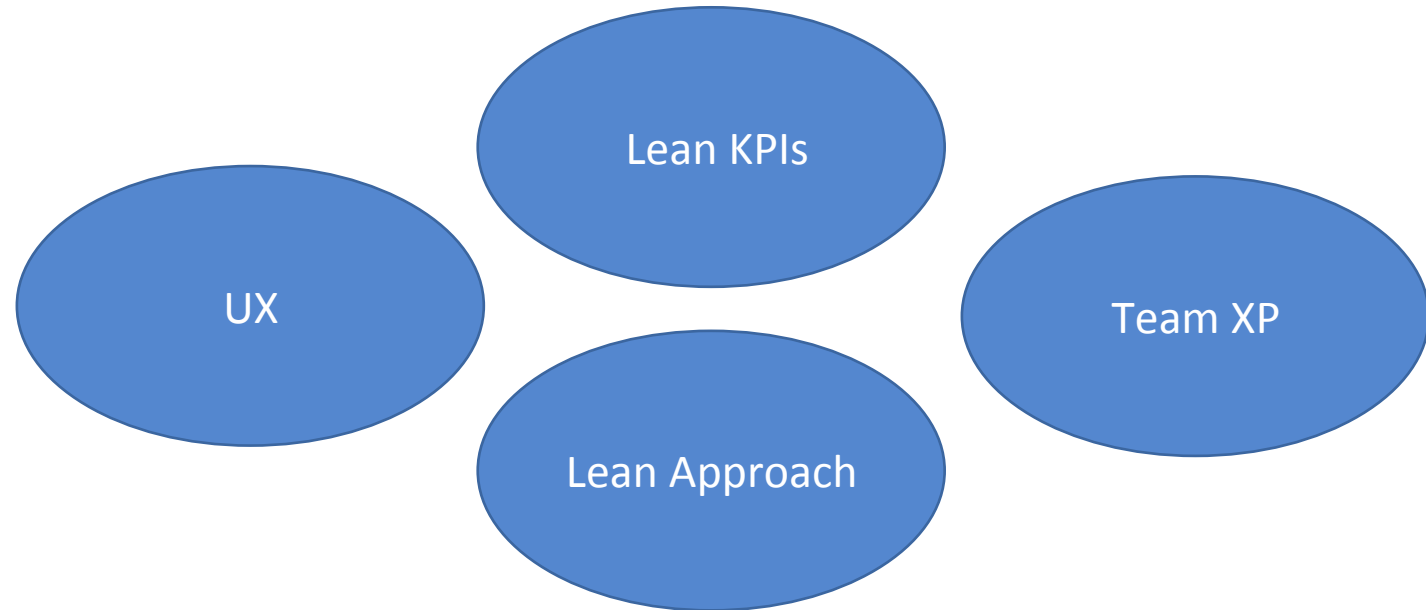

Lean Booster looks at the four dimensions to ensure the success of a lean program:

- performance indicators
- User Experience
- Team Experience
- Lean Approach

Both Data Science and Lean Management are grounded in data. Using one to boost the other through artificial intelligence comes naturally.

Data collected (internally and externally) are analysed with Data Science tools in order to increase their explicative and predictive capacities.

Following the analysis an action plan is proposed to boost the lean program in place in order to reach a new level.
